

ABSTRACT

Actuation device for a flap element

- 5 An actuation device (30) for a flap element, in particular a variable top receptacle (20), having at least one wall element (22) that is pivotable between a first and a second position, wherein the actuation device comprises a fixedly borne spring element (34) and the spring element traverses a point of maximum deflection between its first and second position by interacting with the wall element (22) during pivoting of the wall element (22).
